Total Points plus scoring points = 100 points

Windows Movie Maker –refer to the handout with instructions and illustrations.

Windows Movie Maker has three steps which must be followed to achieve a final product.

- I. First create a folder where ALL photos, videos, music, and the unsaved file is stored.
 1. Import photos, videos, music . Place the photos on the timeline. Each clip appears for approximately 5 seconds. If you want the image to remain longer, copy it more than one time on the timeline.
 - a. Music is place below the time line. Music an be edited to fit a clip.
 2. From the Tmeline view, bring in transitions between slides, Effects to enhance the photos and add interest to still photos. The first slide should introduce the topic. Captions or titles can be added before slides. The last slide may give credits, citations, thanks, etc.
 3. The Final Step is SAVING the product in a step known as “rendering”. When the final product has been correctly rendered the file is saved as a three letter extension .wmv
 - a. If the file is NOT correctly saved the format will be a five letter extension (all caps)
 4. The final product will be rendered and saved to the folder you created in step one.
 5. If you do not correctly save and render the materials, there will be a red X instead of the image you placed on the Timeline.
